Final Project Proposal

Introduction:

Our project entails a sort of ‘distress relief system’, which offers help to the user based on the type of distress they are experiencing. This can range from financial distress, all the way to mental and/or emotional distress, as it is common for different individuals to experience different types of distress. We aim to lend a helping hand in any way we can to those that need it throughout their times of distress.

Description:

We plan on building a website that aims to help individuals through times of distress. Below is a rough draft of the website structure we plan on implementing.

- Main/Home page: Used as starting point for user(s) (let’s try to make this not *too* overwhelming)
- Information page: Used for identifying different types/areas of distress, as well as different ways to help mitigate the distress in each situation
- About Us page: Used to offer the user(s) some insight on our company, as well as how we can help, and how/who we’ve helped in the past
- Apply Now/Contact Us page: Used for user(s) to apply for distress help via various forms (# of forms based on type of distress), as well as contacting a representative, if necessary
- ‘Extra’ page: Used to offer extra help via other companies/individuals, as well as other resources (based on user(s) given distress)
- Types of distress include, but are not limited to: Financial, Emotional, Mental, Physical (injuries), Relationship, Health, etc.
- Possibly add more pages if needed, but we plan on determining that once we start

Programming Language:

We plan on using XHTML, since it is the most appropriate and easiest to use when it comes to building a website.
